ZJQ Series Vacuum Pump

## **ZJQ series Roots vacuum pumps with air-cooling**

### **Summary:**

ZJQ Series air-cooling roots vacuum pump is designed based on the ZJ Roots series vacuum pump to increase the bypass gas cooling system. Because of its special structural design, make its can run reliably for a long time under the high pressure. Under normal circumstances are in the pump outlet or back flow are installed in the piping for heat exchanger. Cooling gas from both sides of the pump body into the pump cavity and cooling of the rotor and the pump cavity, but the pump pumping performance did not affect. Pump can be used alone can also multiple used in tandem, or with liquid ring vacuum pump in series to form a unit and achieve higher vacuum degree to meet the technological requirements.

### **ZJQ Roots series vacuum pump has the following characteristics:**

- Enable to be directly discharged into the atmosphere, no waste water discharge;
- Enable to be connected in series with the former pump composed of Roots unit, energy saving effect is remarkable. Compared with the ordinary Roots pump, the ZJQ Roots pump vacuum can work under high pressure difference, can appropriately reduce the fore pump so as to achieve energy saving effect.
- Wide range of application. Due to the exhaust side can withstand high pressure, effectively solve the ordinary vacuum pump Roots pressure difference is too large, the vacuum degree of the former pump caused by overload, overheating;
- Enable to work under higher inlet pressure series.ZJQ air cooled vacuum pump Roots theory can work under the condition of the entrance to the atmospheric pressure;
- The motor power is not sure. ZJQ series Roots vacuum pump should be confirm the motor power by calculating the maximum differential pressure according to the actual situation.

### **Main technology specification of the ZJQ series Roots vacuum pumps**

| Type     | Suction Speed (L/s) | Limited pressure (Pa) | Max. pressure tolerance (Pa) | Speed (r/min) | Inlet DN (mm) | Outlet DN (mm) | Return port DN (mm) | Power (kW) |
|----------|---------------------|-----------------------|------------------------------|---------------|---------------|----------------|---------------------|------------|
| ZJQ15    | 15                  | 3h 10 <sup>4</sup>    | 8.5h 10 <sup>4</sup>         | 1390          | 50            | 40             | 20                  | 0.55~2.2   |

| ZJQ20000 | 20000               | -                     | 4h 10 <sup>4</sup>           | 990           | 800           | 800            | 300                 | 90~1000    |
| ZJQ30000 | 30000               | -                     | 3h 10 <sup>4</sup>           | 990           | 1000          | 1000           | 300                 | 110~1500   |

#### **Notes:**

The data of the limited vacuum listed in the above table are obtained when the Roots pump assemblies with the proper rotary vacuum pump or slide valve vacuum pump. If the water ring vacuum pump or the oil ring vacuum pump as the fore pump, the limited vacuum will higher than these data. Please refer to the information of the Roots Liquid Ring Vacuum Units.

>> As the cartoon display of the work principle, please refer to the address: <http://www.hanthing.com>

## Work principle of the Roots vacuum pump:

The structure of ZJQ series air-cooled Roots vacuum pumps is as shown in the Figure. In the pump cavity, two rotor (two blades or multi blades) mounted on a pair of parallel axes, the transmission ratio is 1 for a pair of gears with synchronous rotation opposite to each other. In between the rotor and the rotor, between the inner wall the pump shell, maintaining a certain gap, can achieve high speed operation. Compared with the ZJ series Roots vacuum pump, ZJQ series air-cooled Roots vacuum pump with reflux in the side of the pump body position design, the gas into the pump chamber cooling to cool the rotor, the rotor temperature is maintained within the specified scope the ZJQ series of air-cooled Roots vacuum pump can withstand higher pressure (up to 90kPa) without overheating.

## Figures (a) ~ (f) ZJQ are working process of air-cooled Roots vacuum pump:

As Figure (a), in the rotation process, the top of the pump cavity becomes larger, the gas is inhaled; when rotating to the Figure (b), right from the entrance into the V0 rotor pump gas volume; when transferred to the Figure (c), right V0 cavity and the return line is connected, the exhaust side pressure higher than the V0 cavity, so the exhaust gas is cooled after heat exchanger flow to the V0 cavity; when transferred to the Figure (d), a V0 volume of gas left rotor; when transferred to the Figure (e) and (f), the left side of the V0 cavity and the return line is connected, V0 cavity cooled gas return flow to the left; when to continue to Figure (a), the reflux cavity communicates with the exhaust port on the right side of the Figure to continue; (c) when the initial gas discharged from the pump with the right rotor enclosed gas reflux together.

The rotor spindle rotates a circle, 6 gases in volume of V0 are discharged.

## ■ ZJN Series Air-cooling Stainless Steel Roots Vacuum Pump

### Summary:

ZJN series vacuum pump Roots is on the basis of ZJQ air cooled vacuum pump, all the flow components are changed to stainless steel material or other corrosive materials.

ZJN series air cooling type stainless steel vacuum pump Roots work characteristics, technical parameters, principle working and so on can refer to series ZJQ air cooling type vacuum pump Roots.

The material of ZJN series air cooling type stainless steel vacuum pump Roots over current component can be chosen:

S30408 (old brand 0Cr18Ni9, new brand 06Cr19Ni10)

S31603 (old brand 00Cr17Ni12Mo2, new brand 022Cr17Ni11Mo2)

S31803 (SAF2205, new brand 022Cr22Ni5Mo3N)

► ZJN series stainless steel pump body

► ZJN series stainless steel rotor

## ■ LG series Screw Vacuum pumps

### Summary:

LG series screw vacuum pump (also known as twin screw vacuum pump, no oil dry screw vacuum pump) is my company according to the market demand, independent research and development of advanced technology of dry vacuum pump. Because screw vacuum pump without oil lubrication or water seal, pump chamber completely without oil, so screw vacuum pump in the semiconductor, electronics industry requirements without oil clean vacuum occasions and pharmaceutical and chemical solvent recovery process and has incomparable advantage, can be widely used to replace rotary vane vacuum pumps, rotary piston vacuum pump, water ring vacuum pump, water jet vacuum pump, reciprocating vacuum pump, roots water ring vacuum unit.

Screw vacuum pump of a guide process is equivalent to the level of pump, a plurality of guide screw vacuum pump the equivalent of multistage pump series, relative to the claw type vacuum pump, multi-stage Roots vacuum pump and multistage tandem dry vacuum pump, because no internal channel between the screw vacuum pump pump at all levels, but directly to the gas from the suction side push to send to the exhaust side, so in the pumping condensable gas, dust and particles in the gas with uneasy blockage and convenient cleaning.

### Technology parameters:

| Model                                       | LG-30            | LG-70 | LG-100 | LG-180 |
|---------------------------------------------|------------------|-------|--------|--------|
| Maximum suction rate (L/s)                  | 30               | 70    | 100    | 180    |

#### Notes:

The screw vacuum pump is developing and improving by us. Any changes of the above data would not be informed rapidly in the brochure. The up to date details refers to the website: <http://www.hanthing.com>.

### Summary:

- The structure is compact and the floor area is small.
- The structure is simple, the maintenance is convenient; the maintenance and the maintenance of the pump need not special tools.
- Single pump can reach the limit pressure of 30Pa~5Pa, the working range is wider.
- According to the condition system equipped with appropriate roots vacuum pump can be composed of a dry vacuum pump unit, greatly improving the area of low pressure pumping speed and reduce power consumption.
- Pump cavity without oil, no pollution to the pumping system, can get a clean vacuum.
- Pump cavity without oil, it is very easy to achieve the recovery of the solvent.
- The pump cavity and the screw surface are provided with nickel coating or PTFE coating for selection, which can be used to remove a large amount of water vapor and a variety of corrosive media.
- Because of no oil in the work process, waste water discharge, no pollution to the environment.
- The requirement for cooling water is lower, and the normal circulating water can meet the requirements of the pump, and the cooling water is smaller.
- Easy cleaning. Such as pump cavity into the dirt need cleaning, simply open the pump suction port, and the pump is opened from the pump suction port adding amount of water or cleaning agent can pump clean, no need to disassemble the pump.

### Working principle:

As shown in the figure, screw vacuum pump is arranged in a pair of parallel spiral rotor (1 and 2), which in the direction of rotation of a rotor dextral, another thing is left. Two rotor in the pump body (9) through a pair of gear (3) keep synchronous reverse rotation. Between the rotor and the rotor, between the rotor and the pump body without abrasions and to maintain a certain gap, between two rotors and pump body formed seal cavity (4), the rotor coil number equal to the number of seal cavity.

Two rotors in according to the map in the direction of rotation, with the suction port (5) connected to the sealing cavity space becomes larger, gas is inhaled and is transmitted to the exhaust side, the exhaust side of the sealing cavity space (6) in the rotation process becomes small, the gas is compressed to vent (7).

A long time to pump the pump body and the end cover of the jacket (8) in the appropriate amount of cooling water to the pump for cooling.

Because of the heat of compression mainly in exhaust side (6) to generate, in order to fully cooled rotor, in most cases can be the amount of air or other suitable gas by mixing air outlet (10) into the pump chamber.

- ↘ The performance curve of the LG screw vacuum pump on page 85.
- The overall dimension of the LG screw vacuum pump on page 84.

## ■ JZJLG Series Roots Screw Vacuum Unit

### Summary:

JZJLG Roots series screw dry vacuum pump unit is consists of ZJ type roots pump as the main pump, LG series screw vacuum pump as a fore pump is composed of dry without oil vacuum unit. JZJLG Roots series screw dry vacuum pump unit than single screw vacuum pump is more suitable to work under low pressure, such as a vacuum distillation process to pumping rate 150L / s, work pressure is 2000Pa, choose JZJLG150-2 vacuum unit (10.5kw), than the selection of single LG180 screw vacuum pump (22KW) more energy-saving and the unit can reach the lower limit pressure.

As the main pump and the former pump are used to dry pump JZJLG, so Roots series vacuum screw dry pump vacuum unit with the following main features:

- The pump cavity has no oil, no pollution of the pumping system, can achieve clean vacuum.
- The pump cavity has no oil, very easy to achieve solvent recovery.
- Roots pump cavity all the nickel plating layer processing, screw pump cavity of the nickel plating and PTFE processing, smoke removing water vapor, solvent gas and other corrosive medium.
- Because no oil in the work process, wastewater discharge, no pollution to the environment.
- The requirements for cooling water pump for low cooling circulating water can meet the requirements of the ordinary, and the cooling water is small.

The primary pump adopts the company self-developed ZJ Roots series vacuum pump, our company will pump cavity and the bearing cavity sealing was improved after the ZJ Roots series vacuum pump in the pumping process of a large number of water vapor and various solvents oil pump is not easy to be emulsified.

Pre stage pump adopts the company self-developed LG series screw vacuum pump, stable and reliable operation, because between the pump chamber and a gear chamber adopts mechanical seal, LG series screw vacuum pump in not filled with nitrogen protection can still stable.

### Model representation method

Example: J Z J L G 1 5 0 — 2

- |     |   |                                                                                                           |
|-----|---|-----------------------------------------------------------------------------------------------------------|
| J   | - | denotes the first letter of the unit.                                                                     |
| ZJ  | - | denotes the main pump is ZJ series Roots series vacuum pump                                               |
| LG  | - | denotes the fore pump LG series screw pump vacuum                                                         |
| 150 | - | denotes main pump (Roots pump) pumping speed L/s                                                          |
| 2   | - | denotes pumping speed ratio code (that is, pumping speed ratio of the main pump and the former pump is 2) |

**The technology parameters of the JZJLG series Roots-Screw package unit:**

| Unit Type   | Type of the pump |           | Suction Capacity (L/s) | Max. Inhaling pressure (Pa) | Limited pressure (Pa) | Total power (kW) |
|-------------|------------------|-----------|------------------------|-----------------------------|-----------------------|------------------|

**Notes:**

- 1, the types listed in the above table are the standards products. In the actual situation, the changes of the pressure is various. When choose the unit should be calculated precisely and confirmed the type according to the real situations, such as the suction process, the discharge process, the condensation of the gas and the time changes of the inhaling gas etc..
- 2, the technology parameters of each pump refers to their tables in the relative page.
- 3, The Max. Inhaling pressure indicates the highest pressure of the main pump to start.
- 4, When place an order, please give the technical information details such as the pumping medium, working pressure and whether it is explore-proof of the motors.

## ■ JZJ2B Series Roots Water Ring Vacuum Unit

■ One Roots pump + one water ring vacuum pump packaged unit

■ Two Roots pumps + one water ring vacuum pump package unit

### Summary:

JZJ2B Roots series water ring unit is consists of ZJ type roots pump as the main pump, composition 2BV/2BE1 series of water ring pump or Roots--water ring unit as a fore pump pumping unit. It can be used to pumping gas in addition to, can also aspirate containing water, compared to organic solvent or a small amount of dust gas. And general mechanical vacuum pump, not afraid of oil pollution, not afraid of water, gas and dust, and compared with the general water ring vacuum pump, with vacuum high and pump speed characteristics under high vacuum condition.

Due to the adoption of the high efficiency and energy saving of 2BV series water ring pump before the class, so JZJ2B series vacuum unit than jzj2s series with high efficiency, compact structure, no leakage (2BV pump mechanical seal design, different to 2SK series packing seal) resistance to corrosion (2BV adopts stainless steel or aluminum bronze impeller), protection grade higher merit.

Roots vacuum pump using the company's own R & D ZJ Roots series vacuum pump, our company will pump cavity and the bearing cavity sealing was improved after the ZJ Roots series vacuum pump in the pumping process of a large number of water vapor and various solvents oil pump is not easy to be emulsified.

Roots water ring vacuum unit of pump working fluid with water, can also be used in organic solvents (methanol, alcohol, xylene, acetone and other organic solvent or other liquid, using pre - pump as a closed circulation system, can greatly reduce the pollution to the environment, and greatly improve the recovery of the organic solvent. The limit vacuum degree by the working fluid saturated vapor pressure.

■ Three Roots pumps + one water ring vacuum pump package unit

### Roots unit selection considerations:

- Learn to be pumping gas composition, gas containing excluding condensable vapor, dust particles, there is no corrosion. The choice of vacuum pump and need to know the gas composition, the selection of the corresponding pump was pumping gas. If the gas containing steam, particles, and corrosive gases should be the consideration in the pump inlet pipe to install auxiliary equipment, such as condensers, dust collector.

- Roots vacuum unit of the working pressure should meet the requirements of vacuum equipment vacuum and pressure. Such as a vacuum drying process requirements 10mmhg (absolute pressure) of the working pressure, the selection of vacuum pump limit pressure at least 2mmhg, preferably below. Usually choose the limit pressure of the pump is higher than that of vacuum pressure equipment of one half to one order of magnitude.
- Correctly choose the normal operating range of the working point of the roots vacuum units. Roots vacuum unit for maximum suction pressure limit pressure \*. Example: the normal operating range of JZJ2B150-2.1 Roots water ring vacuum unit for: 6000Pa~125Pa. The scope of work as the main pump is turned on normal working pressure range, the unit in the scope of work within the best efficiency.
- Under the pressure of the vacuum unit, the vacuum unit should be able to discharge all the gas generated in the process of vacuum equipment.
- Choose the appropriate unit configuration. According to the practical conditions. For example: JZJ2B300-4.1 unit and JZJ2B300-2.1 unit maximum pumping speed and ultimate pressure is the same, the difference is their work scope and power consumption, the normal working range of JZJ2B300-4.1 unit is 2000Pa~125Pa, and the normal working range of JZJ2B300-2.1 unit 5000Pa~125Pa. obviously JZJ2B300-2.1 units work in a wider range, but its power consumption is greater. If we can confirm the pumping system working pressure is less than 2000Pa, should be preferred JZJ2B300-4.1 group to save energy. But if there is a strong demand for fore pumping unit and unit takes a long time to work at high pressure the system is used JZJ2B300-2.1 the fore pump unit has more appropriate.

### Model representation method

For example: J Z J 2 B 1 5 0 — 2 . 1

- J - denotes the first letter of the unit  
 ZJ - denotes the main pump using ZJ Roots series vacuum pump  
 2B - denotes the fore pump using the 2BV/2BE series water(or liquid) ring vacuum pump ("2S" denotes the fore pump using the 2SK series water (or liquid) ring vacuum pump)  
 150 - denotes the suction speed of the main pump (Roots pump) L/s  
 2.1-denotes code of the suction speed ratio  
 (i.e. the suction speed ratio between the main pump and the secondary pump is 2; the suction speed ratio between the secondary pump and the fore pump is 1.)

### Model representation method

| Unit type    | Pump type |           | Suction capacity L/s | Max. Inlet Pressure Pa | Limited vacuum Pa(abs.) |          | Total power kW |
|--------------|-----------|-----------|----------------------|------------------------|-------------------------|----------|----------------|
|              | Main pump | Fore pump |                      |                        | Water ring              | Oil ring |                |
| JZJ2B15-2    | ZJ15      | 2BV2060   | 15                   | 8000                   | 267                     | 80       | 1.65           |
| JZJ2B30-2    | ZJ30      | 2BV2061   | 30                   | 8000                   |                         |          | 2.25           |

### Notes:

- 1, the types listed in the above table are the standards products. In the actual situation, the changes of the pressure is various. When choose the unit should be calculated precisely and confirmed the type according to the real situations, such as the suction process, the discharge process, the condensation of the gas and the time changes of the inhaling gas etc..
- 2, The technology parameters of each pump refers to their tables in the relative page.
- 3, The max. Inlet Pressure ( Pa) indicates the highest pressure to start the main pump. If the vacuum unit work for a long time under the max. Inlet pressure, it will arise overload of the main pump.
- 4, If it is required of the explore-proof motors, the vacuum gauge and the electric controller, please tell us while you place an order. Then the type 2BV2 and 2BV5 series vacuum pump should be corresponding replaced by the 2BV2-EX and 2BV6 series.

## ■ ZF series package unit

Structure with upright vacuum container

Structure with horizontal vacuum container

### Summary:

ZF series package unit (also known as a vacuum generating device, vacuum station) is composed of one or two sets of water ring vacuum pumps as the device for obtaining vacuum and the vacuum container as the device for storing vacuum. . When the vacuum resource is required constantly and the suction capacity is not required a lot, to use the ZF package unit can save more energy than to use the vacuum pump directly and this can improve the vacuum pump lifetime efficiently.

The ZF series package units are used as the vacuum resource in the large or middle domestic hospitals. They are used extensively as the vacuum station in the chemical and pharmacy, or the canning system in the light industry, or the negative molding of the rubber object in automobile area, or the vacuum sorking of the flammable resistant transmission in mine coal, or the vacuum resource for the molding area etc.

### Work principle

#### 1. Two vacuum pumps

1.1. Set the highest and the lowest vacuum limit of the vacuum system (For example: the highest vacuum is set at -0.08MPa and the lowest vacuum is set at -0.06MPa). When the ZF unit starts, one pump begins to work. Till the vacuum in the container reaches -0.08MPa, the vacuum pump stops automatically and the vacuum status of the container is stored temporary by the non-return valve stopping automatically. If the vacuum in the container is lower than -0.06MPa, another pump works automatically till the vacuum in the container increases to -0.08MPa. By repeating this process, the vacuum in the container always maintains between the highest and the lowest value. If the suction capacity is required stronger, or the vacuum in the container becomes lower than the lowest limited for a period, so the single vacuum pump is not able to reach the lowest limit and the other pump will start automatically till the vacuum in the container becoming even higher than the highest limit.

1.2. These two pumps can also be switched to manual control for on and off.

#### 2. One vacuum pump

At first, to set the highest and the lowest vacuum limit of the vacuum system (for example: the highest vacuum is set at -0.08MPa and the lowest vacuum is set at -0.06MPa. When the ZF unit starts, the vacuum pump works till the vacuum in the container reaching the highest vacuum. And when the vacuum in the container is lower than the lowest vacuum, the vacuum pump works again automatically. The vacuum pump can also be switched to manual control for on and off.

### Performance characteristics:

- The device after the first start, all run process can realize the automatic control. In the process of working, everywhere in the vacuum system of the vacuum degree always within the allowable range fluctuations, and the fluctuation of range can be adjusted according to the requirements of users. If the vacuum is lower than the setting value, the alarm will be issued a warning.
- The device can automatically control the system when the power is cut off, and the vacuum system can be automatically closed during power failure.
- The device is equipped with a gas water separator, which can save water and reduce environmental pollution.
- If the recycling waste water couldn't drained directly, the device should be assembled a heat exchanger to realize the closed-loop circulation of the operating liquid. So the volume of the waste water is reduced much efficiently.
- The vacuum tank of the device can be designed for horizontal and vertical structure according to the site, and the installation is more flexible.

### Notes:

- 1,These pumps listed in the above table are recommended, and they can also be chosen by the actual conditions.
- 2,These types are standard products of our company and they can also be manufactured by the customer's requirements for the special vacuum container, other type pump, or the different connection DN of the flanges.
- 3,The structure of the device can be designed as upright or horizontal type by your requirements when place an order.

■ The sketch map of the ZF series package unit

## ■ ZGP series harrow vacuum driers

### Summary:

ZGP harrow vacuum drier is improved and produced by our company on the basis of the technology of the domestic harrow vacuum drier. According to the various materials, such as, plasm, grease, granule, powder, fibre, the transmitted part is used the column gear box which works steadily and wears well, the active shaft is used the solid shaft of the over-striking stainless steel, and the harrow teeth are made of the high strength foundry stainless steel. By these measures, it can ensure that the harrow vacuum drier works steadily in various rigorous conditions.

### Main usage and characteristics :

---

The ZGP series harrow vacuum drier is mainly used in the drying process of the granular, powder, pulpiness materials in the chemical, pharmacy, food industries etc.. The ZGP harrow vacuum drier is the ideal device especially drying for the heat sensitive materials or easy oxidizing materials.

### Features:

---

- The device has extensive and strong application and fast drying speed. Because the ZGP harrow vacuum drier uses the jacket heating style and with higher discharge vacuum, it is suitable to all the materials with different character or status, such as plasm, granule, powder, especially for the paste materials.
- The device has good quality. During the drying process, the teeth of harrow constantly rotate clockwise or counter-clockwise to stir the materials evenly. So the dried product with fine granularity can be packed directly without any smashing operation.
- The device needs low consumption of the steam.
- The device is operated easy and conveniently to reduce the labor intensity and decrease of the overflow materials.
- If the evaporated solvent needs to be reclaimed, the Drier should assemble a condenser or a tank.

### Disadvantages:

---

- The device couldn't avoid leaving the bottom materials while discharging.
  - It is inconvenient to clean the drier. When the materials often change, the device is not suitable.
- 

### The Dry Theory :

The ZGP harrow vacuum drier covers with a heat jacket where the hot steam, hot water or hot oil flows. The heat conducted from the jacket evaporates the materials, and the steam and solvent is discharged rapidly under the higher vacuum. Therefore, the drier is suitable for those materials that are afraid of high temperature, easy oxidizing, easy powdering (like some dye), or other reclaiming the steam and solvent process.

The materials filled from the top inlet are stirred by the teeth constantly. Then the heat exchange area between the materials and the jacket inner surface is renewed constantly. The water is gasified and discharged by the vacuum pump.

Because the operation vacuum degree is higher, the pressure of the dried material surface is much bigger than that of the drier inner space. It is beneficial to discharge the inner space water and material surface water. And it is beneficial to the water molecules' movement, too. The dry speed is more quickly.

**The main parameters of the ZGP series harrow vacuum driers**

| Model     | Effective Volume (L) | Working volume(L) | Heated area (m <sup>2</sup> ) | Rake gear Speed (rpm) | Transmission Power (kW) | The allowed max. Ratio of the leaked pressure under empty load (1000Pa.L/s) |
|-----------|----------------------|-------------------|-------------------------------|-----------------------|-------------------------|-----------------------------------------------------------------------------|

**Notes:**

1. The types listed in the above table is the normal products, but the special types ordered by the customer aren't included in.
2. The vacuum pump or the Roots vacuum unit that assembled with the ZGP harrow vacuum drier should be selected according to the calculation of the moisture contained volume, the jacket temperature, the working degree, the condenser area and the cooling water temperature. Because the actual application is various, the vacuum pump type and vacuum degree is different much.

### Working Principle:

The harrow vacuum drier is a kind of dryness equipment which uses the decrease of the boiling point of the water containing in the material in the vacuum. This drier uses the indirect heating style with the double casings to heat the water and pump the vapor out in time. In the inner casing, the harrow teeth are driven by the transmission shaft, and a definite angle is designed between the harrow teeth and the shaft line. The active shaft turns in positive and negative direction to make the materials move towards the axial direction till pushed out. By this method, the material can be dried and discharged out efficiently. The heating medium can be used by the steam, heat conduction oil and hot water.

**Structure characteristics:**

- The solid stainless steel shaft is different with the hollow stick which is used in other factories. Because the status of the dried materials is very complicated and the material will become sticky in the dryness process, the best performance of the solid stainless steel shaft is just able to guarantee the steady dryness process.
- The drier body uses the sticker steel board and the normal pressure of the double casing is 0.5MPa. It also can be designed and manufactured according to the different requirements of the customers.
- Cast stainless steel harrow teeth. Most manufactures use the hollow pipe welding harrow teeth which are easy to curve during the dryness process especially to add the knocking sticks in the drier, so the hollow pipe welding harrow teeth have higher failure rate and are easy to be curved and broken. But we design the knocking sticks made of the stainless steel pipes with hollow wall which are approximately as long as the casing length. In the drier casing, the knocking sticks move freely. Normally, there are two or four knocking sticks in the casing to knock the materials constantly till the materials are smashed. So the dryness process is shortened and the finished products are better. The high strength and stability of the cast stainless steel harrow teeth leads to the steadily working environment when add the knocking sticks. The advantages have been proved in the practice.
- The humanism design of the inlet and outlet parts. The inlet part uses the quick unloading flange so that the loading is convenient and quick. The outlet part uses closed discharge structure of the worm wheel which leads to convenient discharge and simple operation and easy pack without residual materials.
- The advanced shaft seal makes the lest leakage. This type of seals is proved better in the process of the solid sodium methoxide which requires the seal highly.
- The drier uses the rolling bearings to ensure the steady work and convenient maintenance.
- The drier uses the bag dust catcher which assembles a back blow device to avoid the pipeline jam.

### Notes:

This structure is only used in the ZGP-1000 and other types whose volume is larger than ZGP-1000. As the driers with small volume, their structure is quick downloaded structure.
